## ABSTRACT

This is an online event management system that serves the functionality of an event manager. The system allows only registered user authentication for better security and usage. The project provides most of the basic functionality required for an event. It allows the user to select event type. Once the user enters an event type eg (Weddings, photography, Dance shows, birthday parties etc), the system then allows the user to schedule the event along with its requirements. All this data is registered in the database and user gets the confirmation. This data is then sent to the administrator and they may interact with the client as per his requirements. The system is useful as it calculates an exact cost for all the resources required during the event. The user gets all the resources at a single place instead of wandering around for these. This system is effective and saves time and cost of the users.
