## ABSTRACT

Nowaday's healthcare industry is to provide better healthcare to people anytime and anywhere in the world in a more economic and patient friendly manner. In the present paper the physiological parameters such as Heartbeat, temperature, salinity are obtained, processed using ARM9 LPC 2138 processor and displayed in a PYTHON graphical user interface. If any vital parameter goes out of normal range then alert Email message to the respective patient. This system is utilizing Team viewer software and low cost component to transmit data to physician to monitoring ,diagnosis and patients care at significantly loecost, regardless of patient's location. The electronics technology has entered almost in all aspects in all aspects of day-to-day life, and the medical field is not exception for that.

The need for well-equipped hospitals and diagnostic centres is increasing day by day as the people are becoming more conscious about their health problems. In biomedical fields special units are used ,such as intensive care unit or ceremony care unit. All of these units are designed to offer the advantage of low nurse patient ratio and concentration equipment and the resources needed; to take care of critically ill or seriously injured units .The computer based signal acquisition ,processing and analysis system using PHYTON to display values. This paper discusses the aspects of acquisition of physiological parameters like temperature, heartbeat, salinity pre-processing them and displaying them in a graphical user interface for being viewed by the doctor and also observe the clinically useful data , firstly doctors computer and all android mobile which contains a team viewer application. the system is expected to monitor patient under critical care more conveniently and accurately for diagnosing which can be interfaced with computer to bring a under a network system widely for the doctor to monitor patient condition sitting in his own office without being physically present near to the patient's bed.
